Product description

A variable and complete system: hygienic, flexible, energy efficient
Its high variability makes the EMC so interesting for many industries and applications. By using the available configuration options, a cheaper, simpler base cylinder can be adjusted to virtually any customer requirement: chemical resistant, with perfect sealing and a high IP enclosure protection class. All these properties ensure a long service life – even under harsh industrial conditions. The powerful EMC always performs very efficiently. The resulting energy saving potential makes it an economical alternative to pneumatic systems.

Structural design
The mechanical system in the electromechanical cylinder is based on proven Rexroth ball screw assemblies in a variety of diameter and lead combinations. The Rexroth ball screw assembly converts the motor torque into linear motion with high mechanical efficiency. During this process, the piston rod fastened to the screw drive nut is extended and retracted.
Both the screw drive nut and the piston rod are guided in the housing and cannot twist.
Optional limit switches prevent damage to the cylinder in operation. A reference point switch is available for the use of incremental encoder systems.
Thanks to grease lubrication, electromechanical cylinders EMC require only minimal maintenance at long intervals.

Advantages
- High-precision Rexroth ball screw assemblies: for high performance with maximum cost-effectiveness
- Complete building system with great variability: can be adapted to a wide range of applications
- A ready to install and turn on system for low design and assembly costs
- The smart, freely programmable drive system allows the realization of complex travel profiles (parameters for force, position and travel speed can be set as required over the complete working travel range)
- Optimized lubrication concept: optional connection to a central lubrication system reduces downtime
- Soundly sealed against dirt and water from the outside and lubrication leakage from the cylinder by selecting the IP65 enclosure protection class option
- Hygienic design: High resistance to chemicals and cleaning agents by selecting the option IP65 + R (resistant)

Notes on lubrication

- Liquid grease lubrication prepared for connection to central lubrication systems
- High operational reliability through automated relubrication
- Need-based maintenance reduces consumption of lubricant, while ensuring high availability
- More degrees of freedom as lubrication is not dependent on position and installation location
- Low-cost unmanned maintenance
- Observe the "Lubrication position" for relubrication. Further information on this and on lubrication see chapter "Lubrication and maintenance"

Lubrication versions

LSS:

- Initial lubrication (standard lubrication) carried out by Bosch Rexroth with Dynalub 510
- Relubrication using manual grease gun

LCF:

- Prepared for connection to central lubrication systems for liquid grease (grade NLGI 00 in accordance with DIN 51818) with Dynalub 520
- Lubrication with liquid grease only via single-line piston distributor system
- Basic lubrication required

LPG:

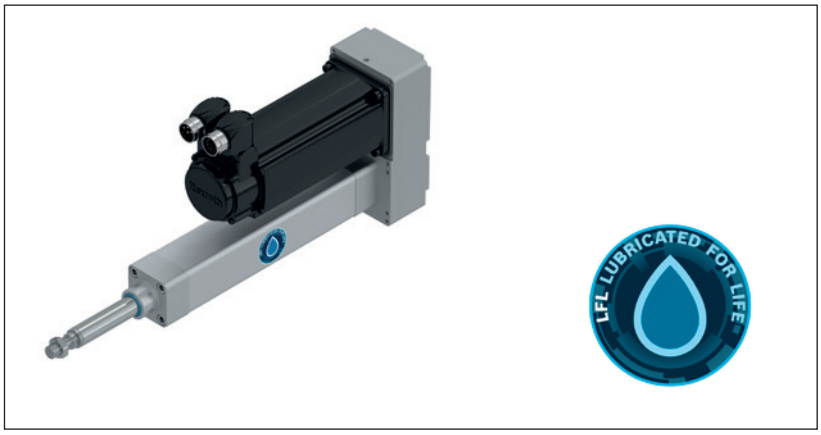
- With corrosion prevention; relubrication with manual grease gun; basic lubrication required

LHG:

- Initial lubrication with NSF-H1 grease

LFL:

- Lifelong lubrication with Mobilith SHC 460 (R913073149)
  Application conditions:
  - Service life ≤ 15,000 km
  - Average load (F_m /C) ≤ 0.05
  - Average linear speed (V_m) ≥ 0.05 m/s



Application areas

Electromechanical cylinders EMC can be used in many application areas. Due to their specific characteristics, they offer advantages in terms of accuracy, dynamics and controllability, and can therefore not only help to shorten cycle times but also to increase flexibility and quality in the manufacturing process. Their space-saving design makes them ideal for use in tightly confined spaces.

Possible application areas are:

- Servo presses and forming technology
- Joining technology
- Thermoforming
- Injection molding and blow molding machines
- Woodworking machines
- Assembly and handling technology
- Packaging machines and conveyor systems
- Food processing machines
- Testing equipment and laboratory applications
- Special machines

Application examples

Joining and pressing

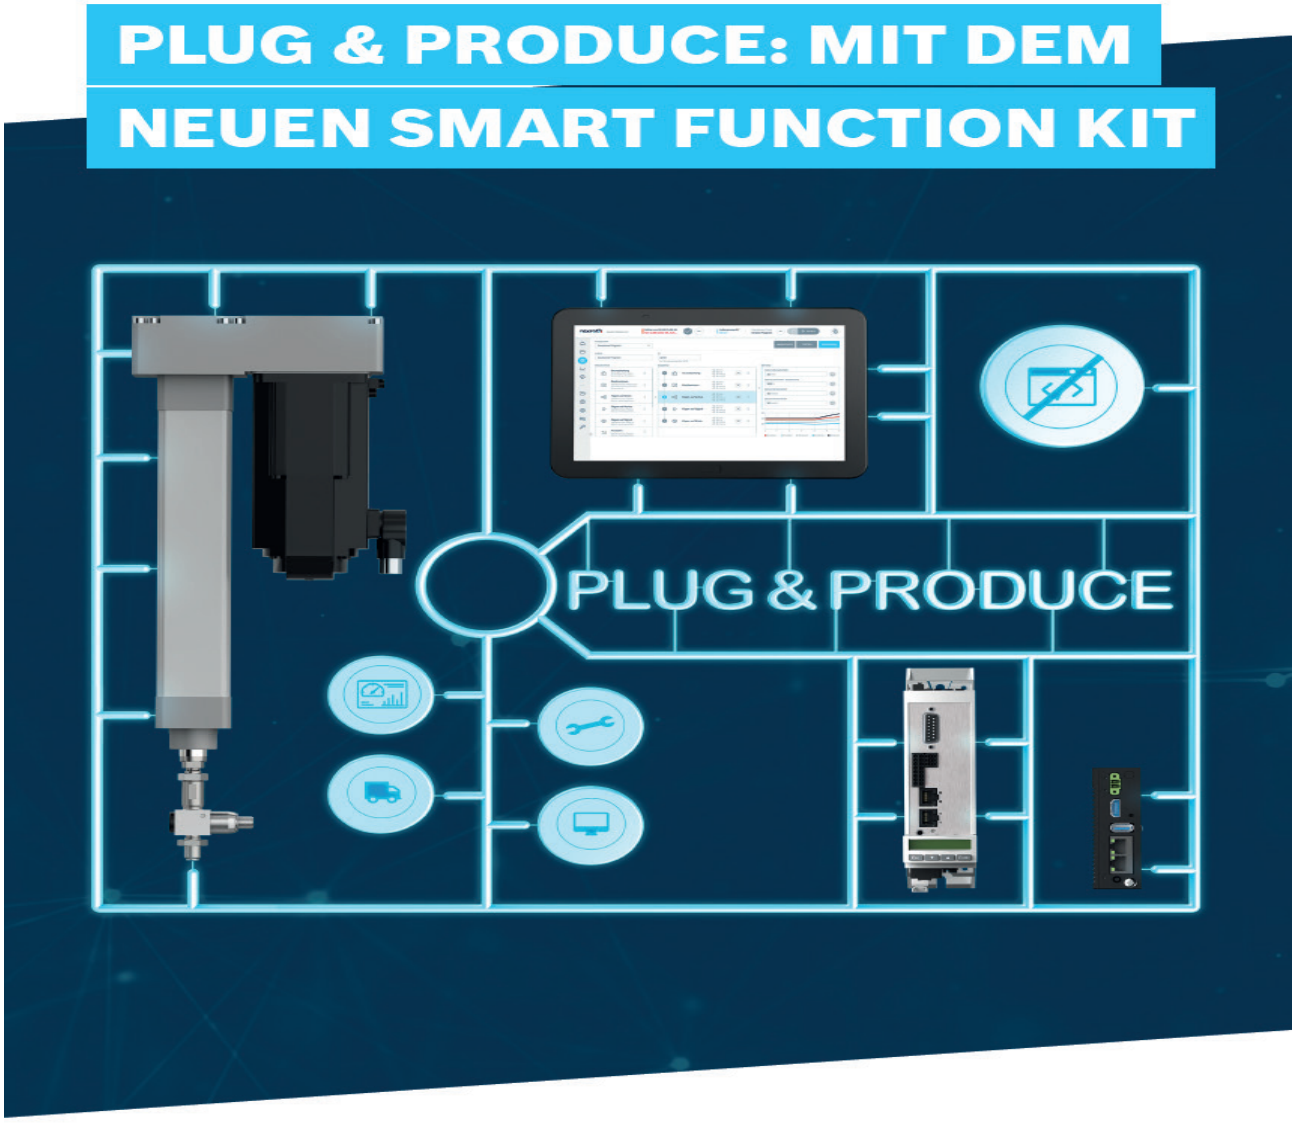
Forming / thermoforming

Lifting

FASTER, MORE PRODUCTIVE, SMARTER.
THE NEW SMART FUNCTION KIT.

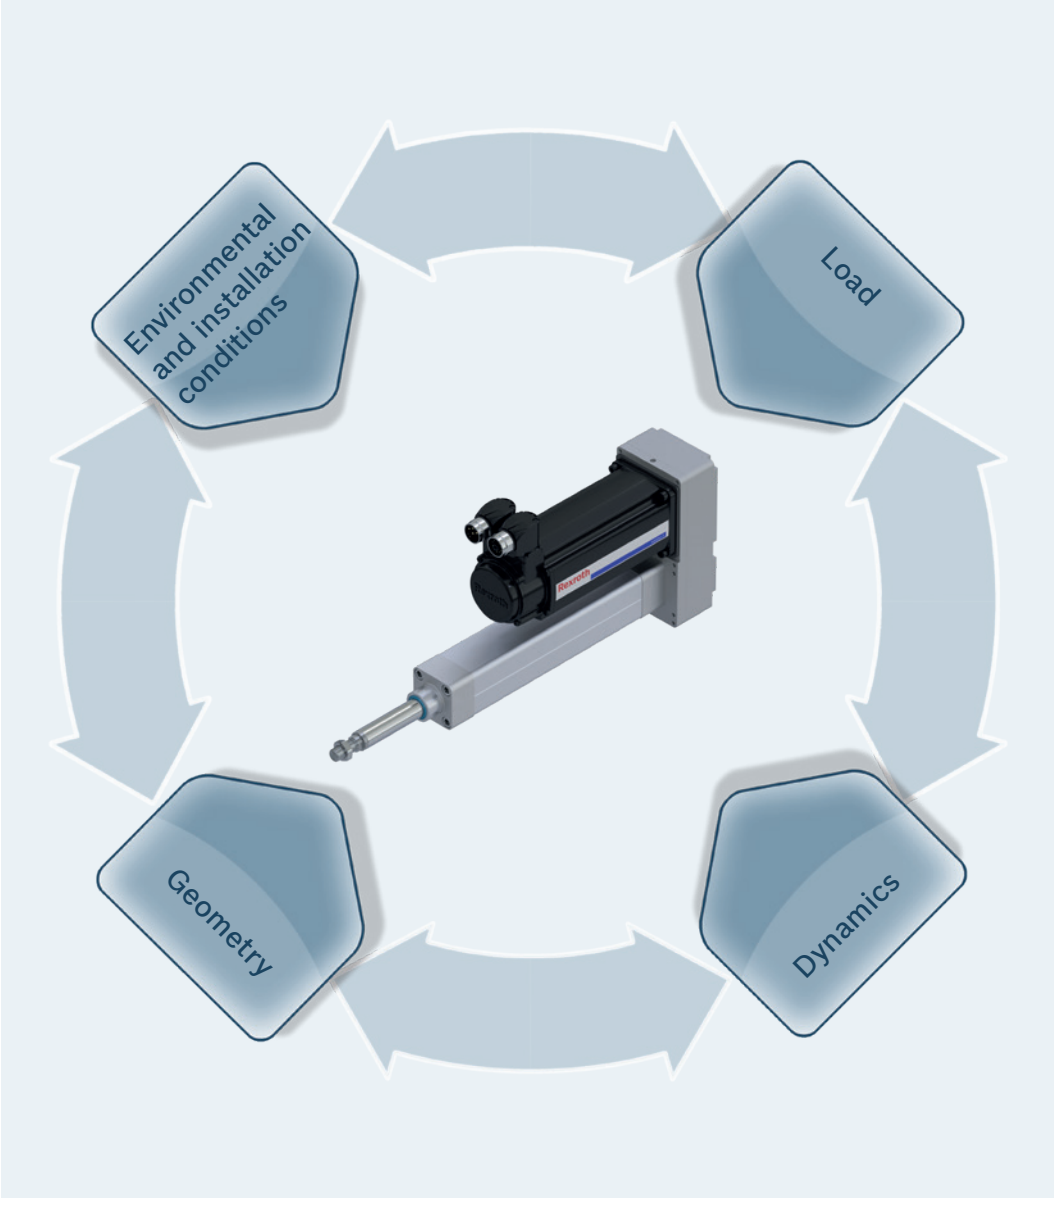


Times are changing. And so are industry requirements and processes. The trend is shifting away from individual products to simple and fast solutions with greater independence. The same applies to all pressing and joining processes in the Factory of the Future. With the new Smart Function Kit, Bosch Rexroth is meeting precisely these requirements for machine and plant manufacturers. It is a simple, fast and efficient package solution for versatile applications with pressing and joining functions. It functions according to the Plug & Produce principle and works with proven Rexroth components as well as browser-based software interfaces for all types of devices. Thanks to simple product selection, short delivery times as well as fast start-up and process configuration, the time spent on engineering can be reduced by up to 95%. Further information at:
https://www.boschrexroth.com/en/xc/products/product-groups/linear-motion-technology/news/smart-function-kit/index

Product selection guide

To make sure your electromechanical solution delivers optimal performance, both technically and economically, the right decisions have to be made as early as the planning phase. The following key parameters have a decisive influence on the choice of system and its structural design:

- Load
- Dynamics
- Geometry
- Environmental and installation conditions



Load
- Process force
- Masses
- Duty cycle
- Service life requirement
- etc.

Dynamics
- Acceleration
- Travel speed
- Cycle time
- etc.

Geometry
- Working area
- Installation space
- Stroke length
- Interference contours
- etc.

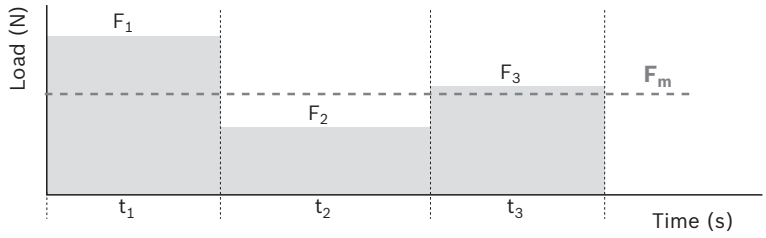
Environmental and installation conditions
- Installation position
- Fastening options
- Degrees of freedom
- Temperature
- Humidity
- Contamination
- Vibration and shocks
- etc.

An electromechanical cylinder EMC that is optimal for your needs in just six steps

Electromechanical cylinders EMC offer higher dynamics and precision, better controllability, and greater mechanical efficiency than the majority of fluid-power drives (e.g. hydraulic cylinders). It is particularly important to fully define application requirements in advance because of the special characteristics compared to fluid-driven technology.
To find the most cost-efficient solution for your application, the following input parameters should be known:

1. Loads

An EMC solution that is both economical and reliable can be found when the loads (process forces and masses) are known as accurately as possible. Along with the maximum force in the application, it is important to also state changing forces over the stroke so that the average load over the entire cycle can be determined. This average load forms the basis for the service life calculation.
Large safety factors for the force required, as are common in some fluid-power applications, should be avoided so that the axis is not over-sized. A differentiation also needs to be made between static load (cylinder at standstill) and dynamic load (during feed motion).



2. Duty cycle

The duty cycle is the percentage ratio of operating time to total cycle time. The duty cycle is an important input parameter for both the estimation of the total service life of the cylinder and for the thermal assessment of cylinder and motor.
Pause times should always be stated in the calculation as well.

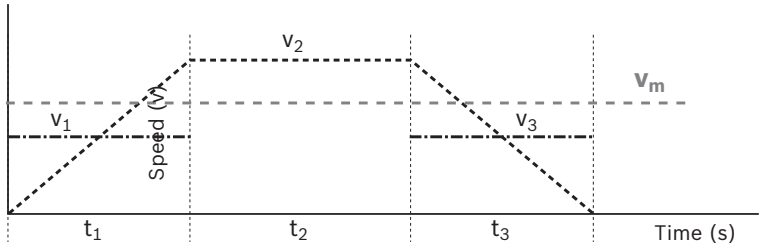
$$ED = \frac{t_B}{t_B + t_P} \cdot 100\%$$

ED = Duty cycle (%)
t_B = Operating time (s)
t_P = Pause time (s)

Product selection guide

3. Total cycle

By stating the acceleration and linear speeds as accurately as possible or the necessary cycle time and the travel range, it is possible to adapt the complete drive chain to maximize results for the application.
The EMC and drive can be selected so that requirements are met precisely and efficiently.

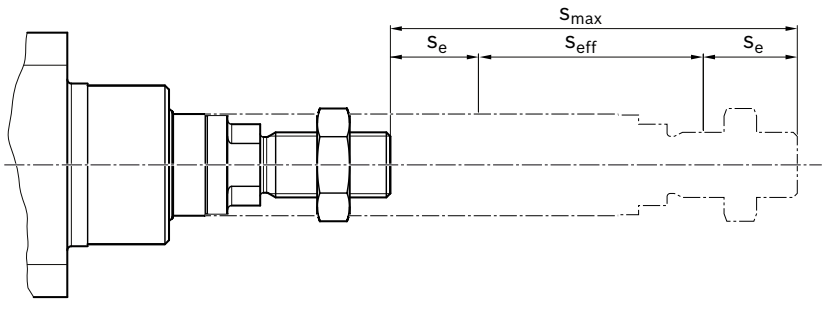


4. Integration in the machine

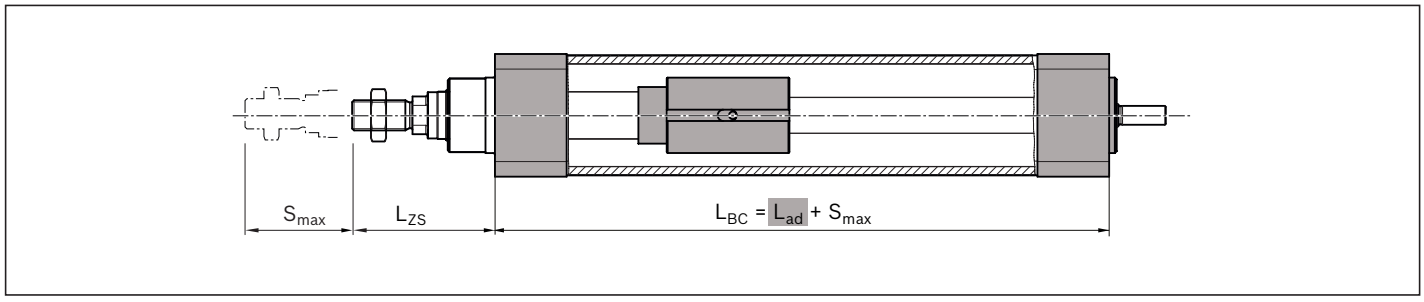
Transverse forces on the piston rod and alignment errors during assembly can shorten the service life of the electromechanical cylinder EMC.
During fastening, it must be ensured that the cylinder is mounted free of distortive stresses and heavy transverse loads are absorbed by an external guideway.
In addition, the type of attachment and the EMC fastening element have an effect on the maximum permissible axial load. (see section "Axial load" in the chapter "Technical data", see also "Fastening elements").
For an extensive and optimally balanced range of fastening elements, please refer to chapter "Attachments and accessories".

5. Travel range and overall dimensions

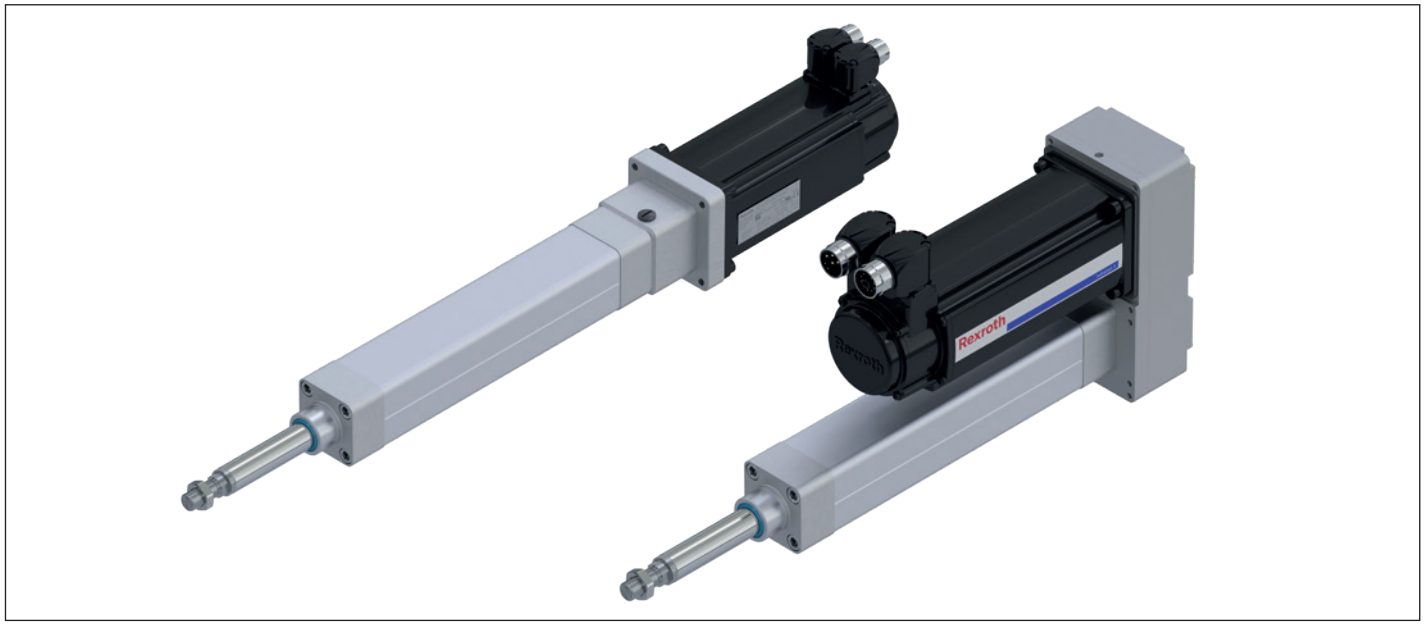
Determine the necessary operating stroke in your application. As electromechanical cylinders EMC must not be allowed to travel right up to the mechanical end stop, it is important to add excess travel (s_e) to both ends of the effective operating stroke (s_{eff}). This maximum travel range (s_{max}) is the parameter to be stated when ordering the cylinder.



For structural design reasons, the overall length of the cylinder is greater than the maximum travel range (s_{max}), as it includes the length of components such as the screw drive nut and the bearings (represented by L_{ad}), in addition to the travel range. The dimension L_{ZS} describes the position of the piston rod in the retracted position.



The cylinder can be adapted to the available installation space by mounting the motor as an extension to the axis (flange and coupling) or parallel to the axis (belt side drive). The type of motor attachment chosen also has an effect on the technical performance data and the selectable fastening methods.



6. Ambient conditions

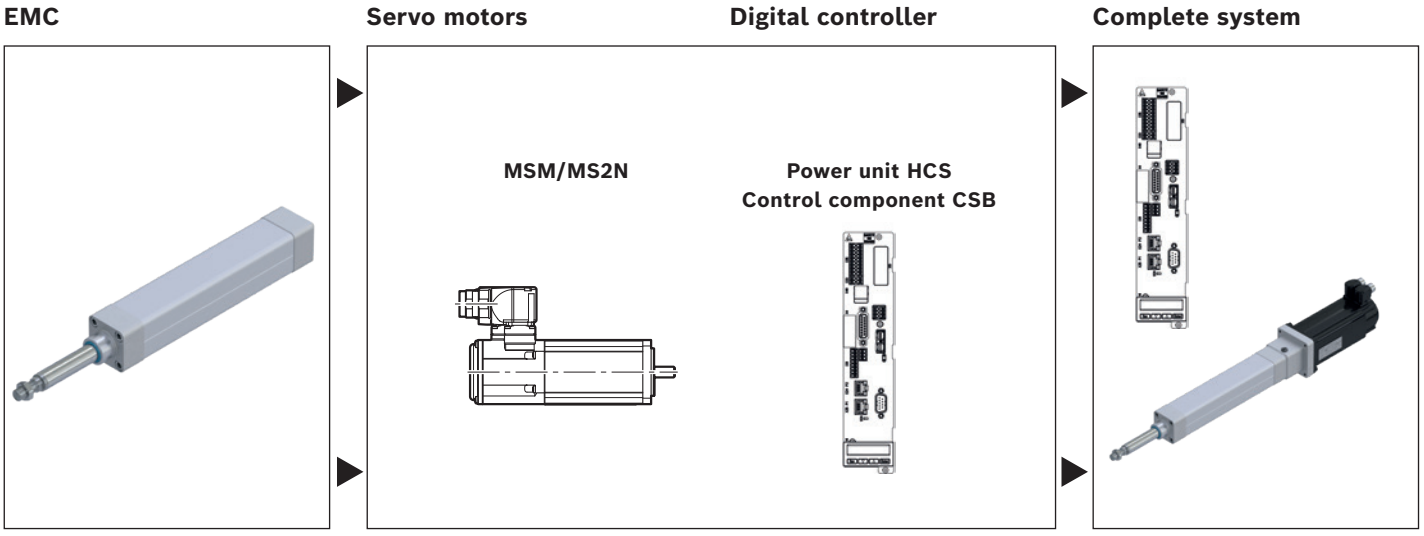
The environment in which a cylinder is operated can have a significant effect on its service life. Both very high and very low temperatures can affect seals, lubrication and the performance of the motor. Abrasive dirt and chemicals can damage the seals and ultimately cause the screw drive to fail over the long term.
Please ask if your application involves special environmental conditions.

Motor-controller combination

Several motor-controller combinations are available in order to provide the most cost-effective solution for every customer application. When sizing the drive, always consider the motor-controller combination.

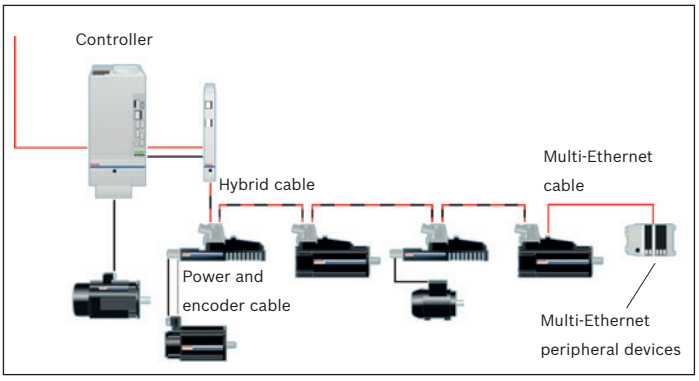
Notes on motors and controllers

- Motors are available with control units and controllers
- For recommended motor-controller combinations, see chapter "Motors"
- You can find more information on motors and controllers in the Rexroth catalogs on drive technology at www.boschrexroth.com/mediadirectory.



IndraDrive Mi distributed drive system

Control electronics and servo motor in one space-saving unit. The IndraDrive Mi is the ideal solution for applications that depend on minimum space yet require maximum flexibility and cost-effectiveness.
IndraDrive Mi – the new generation of cabinet-free drive technology from Rexroth.
For more information, see "Drive system Rexroth IndraDrive, R999000018".

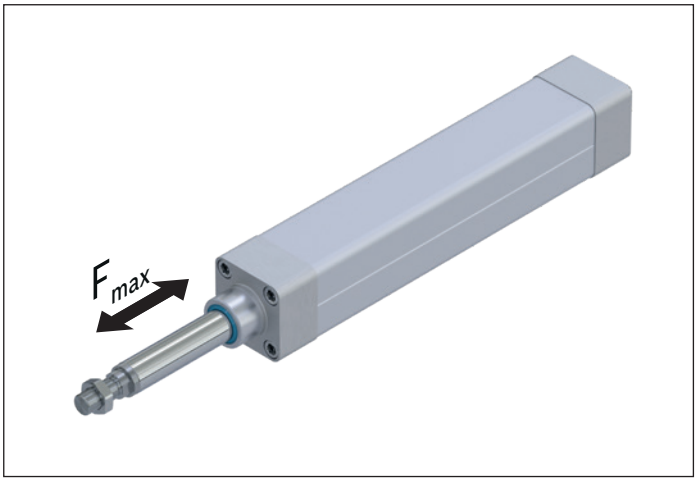


Up to 20 IndraDrive Mi in a chain - these motor-integrated servo drives (KSM) and servo drives close to the motor (KMS) are freely combinable. Via further KCU, additional IndraDrive Mi chains can be integrated.

Product overview

Note on dynamic load rating
In relation to the desired service life, generally speaking an equivalent dynamic axial load of up to about 20% of the dynamic load rating (C) has proven effective.
(see also service life graphs in chapter "Technical data".)

Do not exceed the technical data.



The size designation 32 to 100 is selected according to the piston diameter of an ISO 15552 standard cylinder.
The built-in Rexroth ball screw assemblies have a diameter of 12 mm to 50 mm.

EMC	d_0 x P	C (N)	F_{max} (N)	$s_{max\ zul}$ (mm)	v_{max} (m/s)
32	12x5	4 100	1 200	750	0.57

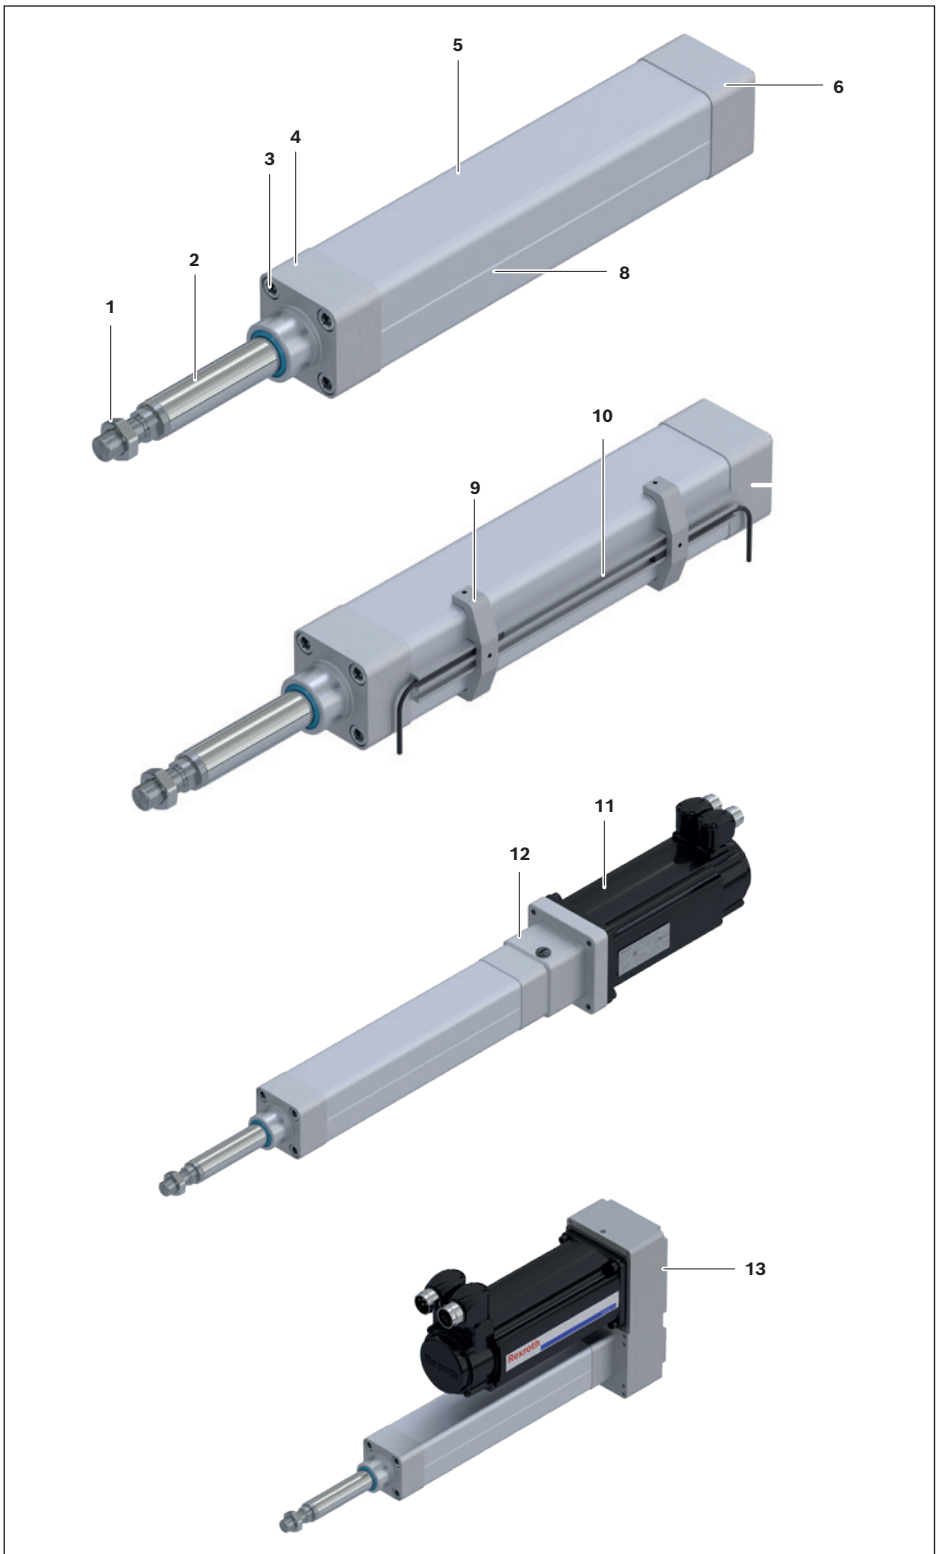
For short product names, see chapter "Abbreviations".

Structural design

1 Hexagon nut
2 Piston rod (stainless steel)
3 Hex socket head cap screw (for mounting fastening element and motor attachments)
4 Cover
5 Housing
6 Bottom
7 Screw journal
8 Slot for sensor profile (opposite the lube connection)

Attachments

9 Retaining bracket (for sensor profile)
10 Sensor profile
11 Motor
12 Flange and coupling
13 Belt side drive
14 Lube connection for lubrication versions LSS, LCF, LPG, LHG; for lubrication version LFL: Housing without lube connection
15 Connection for pressure compensation



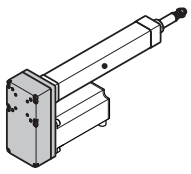
Motor flange and coupling

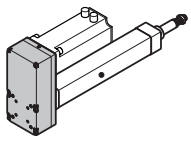
The motor flange is used to fasten the motor to the EMC and as a closed housing unit for the coupling. With the coupling, the drive torque of the motor is transmitted free of distortive stresses on the screw journal of the EMC.

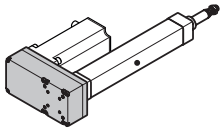
Belt side drive

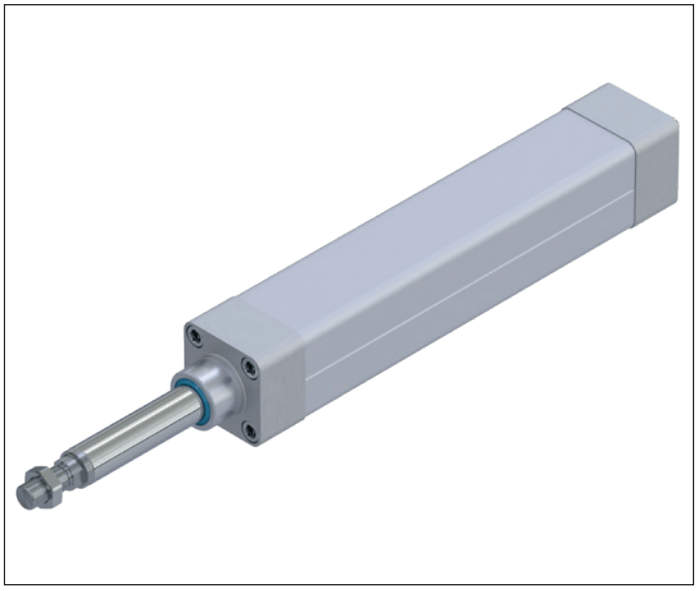
This configuration results in the shortest possible overall length of the EMC.
The space-saving, closed housing serves as protection for the belt, motor bracket and to connect fastening elements.
Various gear ratios are available:
i = 1 : 1
i = 1 : 1.5
i = 1 : 2
The belt side drive can be mounted in three directions (RV01 to RV03).

RV01	RV02	RV03
		



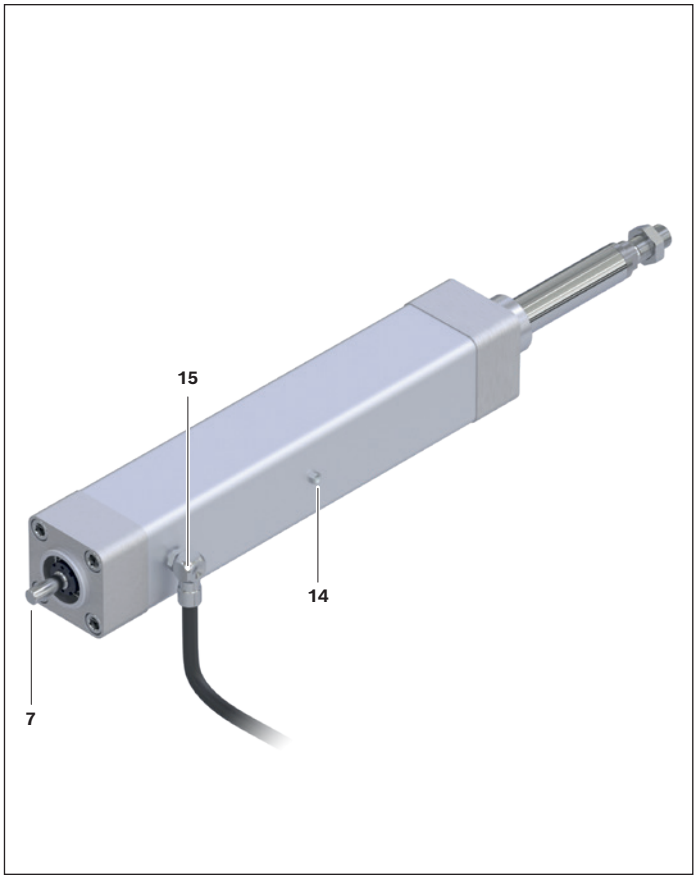






Features at a glance

- The hygienic design of the EMC with smooth surfaces prevents the formation of dirt and allows for easy cleaning of the cylinder. A sensor profile can be mounted to the housing to allow the use of limit and/or reference switches outside of the aluminum profile.
  The EMC is pre-lubricated with standard grease or NSF-H1 grease and is therefore ready for immediate use. Alternatively, the built-in Rexroth ball screw assembly can also be ordered only conserved for initial lubrication by the customer. The EMC can be connected to a central lubrication system with liquid grease. A lube connection is included if the appropriate lubrication option has been selected.



IP65 enclosure protection class

- Seals between the end caps and the housing and a reinforced seal on the piston rod ensure reliable protection against dust and water ingress. A connection for pressure compensation (15) in the housing prevents underpressure in the cylinder by allowing controlled air flow between interior and environment. The electric cylinder and motor mountings with IP65 fulfill the requirements according to IEC 60 529.

IP65 enclosure protection class +R (resistant)

- In addition to the benefits of the IP65 rating, this version provides chemical resistant seals between the end caps and the housing, as well as at the piston rod.
  The lube connection (14), the connection for pressure compensation (15) and the hexagon nut (1) are made from stainless steel.
  As additional accessories corrosion-resistant plug screws for the hex socket head cap screws in the cover are available.

1) Total axial clearance of the EMC when new
2) Constants for calculating the mass moment of inertia. For formulas, see chapter "Drive dimensioning"

Note:
The travel range can be selected in mm steps between s_{min} and $s_{max\ zul.}$.

Mass of the EMC
Weight calculation without the motor and without motor attachment

$$m_s = k_{g\ fix} + k_{g\ var} \cdot s_{max}$$

Weight calculation without motor with belt side drive

$$m_s = k_{g\ fix} + k_{g\ var} \cdot s_{max} + m_{sd}$$

Weight calculation without motor with flange and coupling

$$m_s = k_{g\ fix} + k_{g\ var} \cdot s_{max} + m_{fc}$$

Moved mass of system

$$m_{ca} = m_{ca\ fix} + m_{ca\ var} \cdot s_{max}$$

Length calculation

$$L_{BC} = s_{max} + L_{ad}$$

	Total axial clearance cylinder[1] (µm)	$k_{J\ fix}$[2]	$k_{J\ var}$[2]	$k_{J\ m}$[2]	m_s		m_{ca}

[1] Constants for calculating the mass moment of inertia. For formulas, see chapter "Drive dimensioning"
[2] Force or torque and speed can be limited by the motor

Mechanical efficiency η = 0.9 (for all sizes)

Note:
All data is given for the complete mechanical drive chain (EMC with coupling) at the reference point motor shaft.
F_{max} and v_{max} depend on the selected travel range (s_{max}) of the EMC. See the following tables.
Actual results depend on the selected motor-controller combination.
The motor torque might need to be limited.
For short product names, see chapter "Abbreviations".

[1] Gear ratio of the belt side drive.
[2] Constants for calculating the mass moment of inertia. For formulas, see chapter "Drive dimensioning"
[3] Force or torque and speed can be limited by the motor

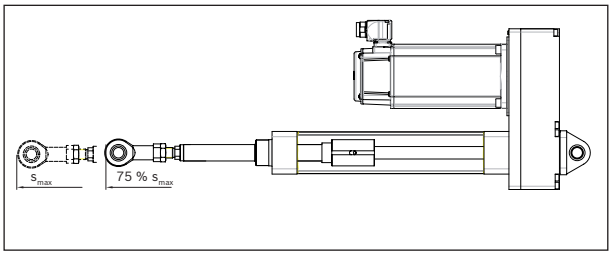
Mechanical efficiency η = 0.9 (for all sizes)

Note:
All data is given for the complete mechanical drive chain (EMC with belt side drive) at the motor shaft reference point.
F_{max} and v_{max} depend on the selected travel range (s_{max}) of the EMC. See the following tables.
Actual results depend on the selected motor-controller combination.
The motor torque might need to be limited.
For short product names, see chapter "Abbreviations".

Axial load on the cylinder mechanics

Note on special installation and usage example

Installation case III



Note: In this installation case the cylinder mechanism of the EMC is loaded by its dead weight in a horizontal position.
Thus, the piston rod may be extended horizontally only up to 75% of s_{max}.

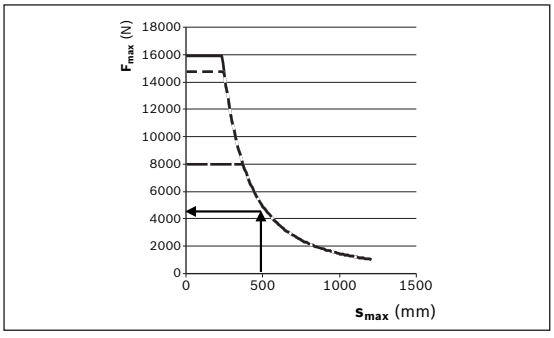
Application example:
Installation case III: Swivel clevis mount on the belt side drive, piston rod guided by means of rod end bearing or fork clevis.

Example for determining the permissible axial load on the cylinder mechanics

Pre-selection for the above installation case III as an application example:

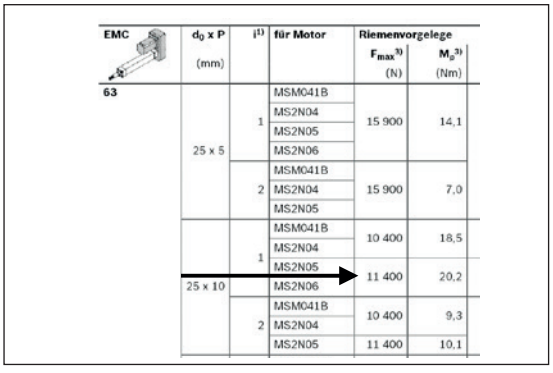
- EMC-063 with Rexroth ball screw assembly 25 x 10
- selected travel range s_{max} 500 mm
- with belt side drive i=1 for MS2N05
- fastening with clevis mount and swivel mount

Max. permissible axial load according for installation case in the diagram: approx. 4,200 N.



F_{max} in table "Drive data" with motor attachment via belt side drive:
F_{max} = 11,400 N

The actual achievable axial force of the system also depends on the selected motor / controller combination
(see chapter "Drive dimensioning").



EMC	d_0 x P (mm)	i[1]	für Motor	Riemenvorgelege F_{max}[3] (N)	Riemenvorgelege M_p[3] (Nm)
63	25 x 5	1	MSM041B	15 900	14,1
			MS2N04		
			MS2N05		
			MS2N06		
		2	MSM041B	15 900	7,0
			MS2N04		
			MS2N05		
	25 x 10	1	MSM041B	10 400	18,5
			MS2N04		
			MS2N05	11 400	20,2
			MS2N06		
		2	MSM041B	10 400	9,3
			MS2N04		
			MS2N05	11 400	10,1

Note: Limitations caused by additional orderable fastening elements are not taken into account in the consideration of the drive chain.

The F_{max} for the size 63 clevis mount, for example, is 10,900 N.

For F_{max} the smallest value is 4,200 N.

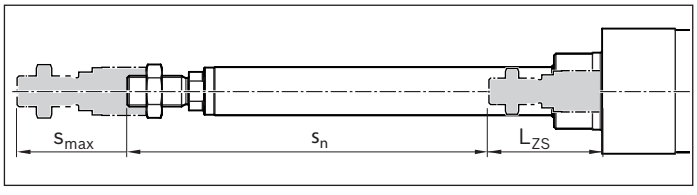
F_y = Lateral force (N)
s_n = Position of the piston rod (mm)
s_{max} = Maximum travel range (mm)
L_{ZS} = Position of the piston rod retracted (mm)

Diagrams are valid for:

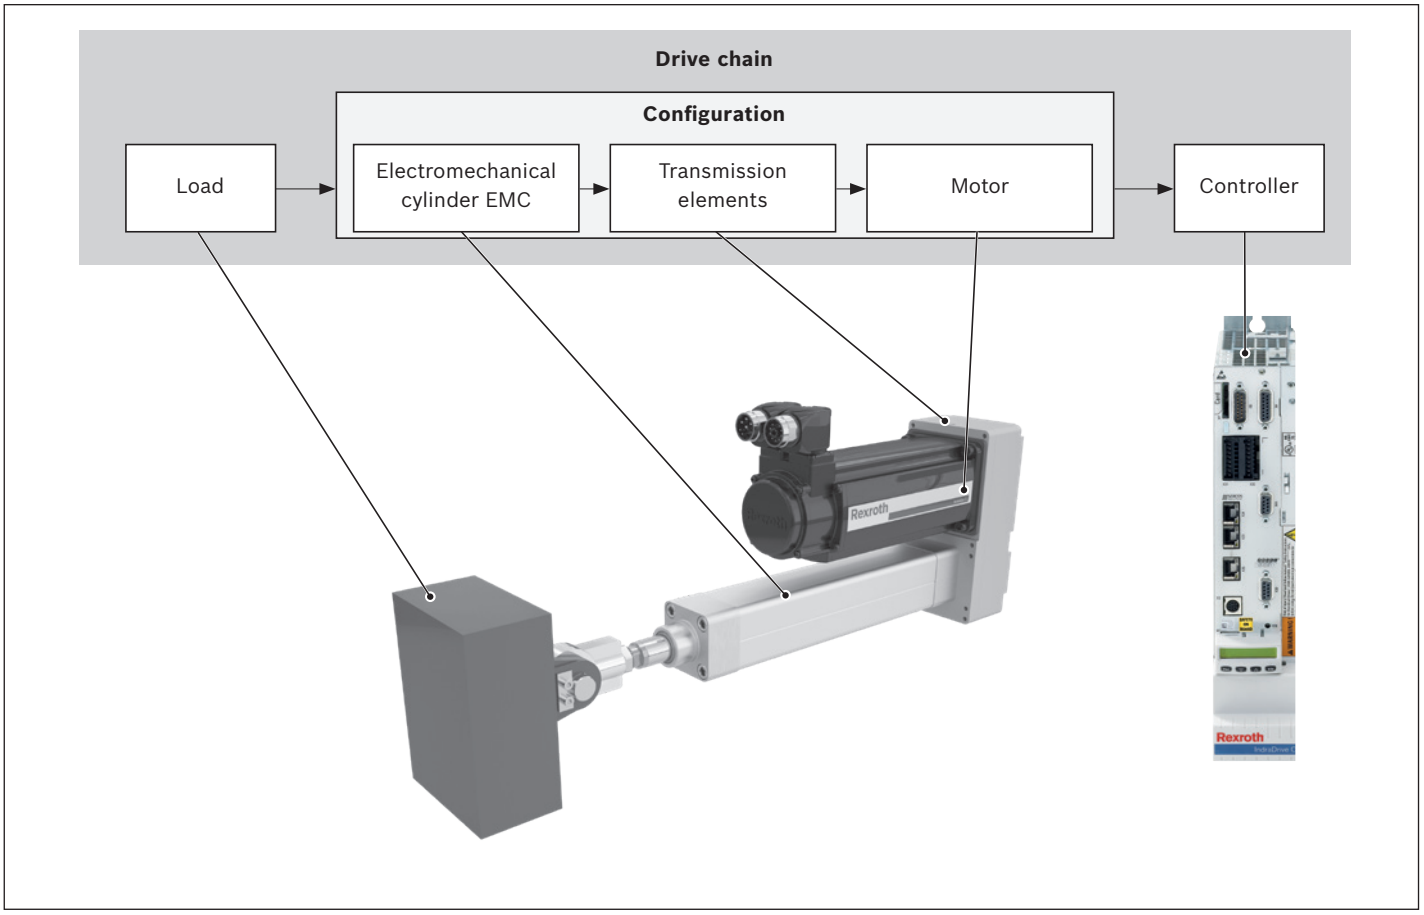
- 25% of F_{max}
- a speed of 0.5 m/s

Definition s_{max} /s_n



Calculation principles

Drive chain



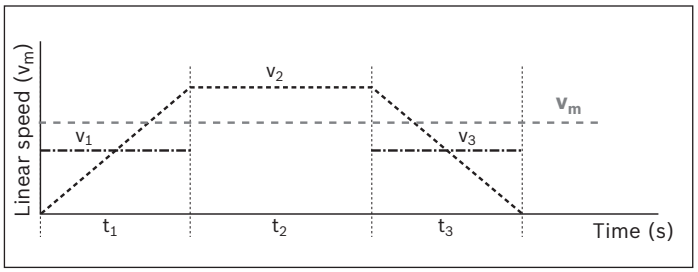
The correct dimensioning and assessment of an application requires structured consideration of the entire drive chain. The basic element of the drive chain is the configuration – comprising the electromechanical cylinder EMC, the transmission element (coupling or belt side drive) and the motor, which can be ordered in this constellation as per the catalog.

Maximum permissible loads

When selecting electromechanical cylinders EMC, maximum limits for permissible loads and forces must be taken into account. These limits can be found in chapter "Product description and technical data".
The values in this chapter are system-based, i.e. the limits are based not only on the load rating of the bearings, but also on design/material limits.

Mechanical calculation

Service life of electromechanical cylinder EMC
Where the operating conditions vary (fluctuating linear speed and load), the service life must be calculated using the average values for F_m and v_m.

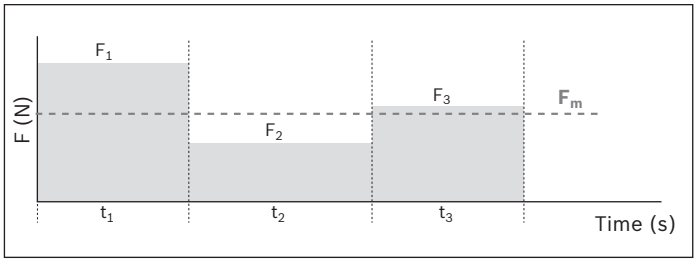


When the linear speed varies, the average speed v_m is calculated as follows:

$$v_m = \frac{1}{t_{ges}} \cdot (|v_1| \cdot t_1 + |v_2| \cdot t_2 + \ldots + |v_n| \cdot t_n)$$

$$t_{ges} = t_1 + t_2 + \ldots + t_n$$

When both the load and the rotary speed vary, the average load F_m is calculated as follows:



$$F_m = \sqrt[3]{|F_1|^3 \cdot \frac{|v_1|}{v_m} \cdot \frac{t_1}{t_{ges}} + |F_2|^3 \cdot \frac{|v_2|}{v_m} \cdot \frac{t_2}{t_{ges}} + \ldots + |F_n|^3 \cdot \frac{|v_n|}{v_m} \cdot \frac{t_n}{t_{ges}}}$$

Nominal service life
– in revolutions L

$$L = \left(\frac{C}{F_m} \right)^3 \cdot 10^6$$

– in hours L_h

$$L_h = \frac{L}{n_m \cdot 60}$$

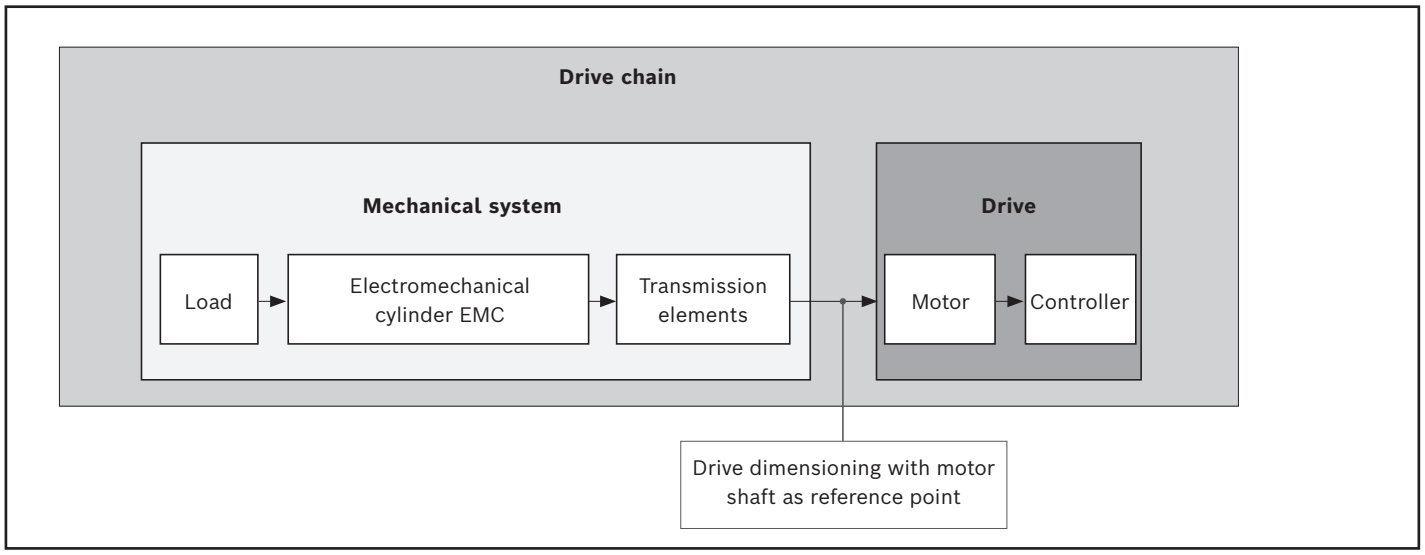
Drive torque M:

$$M = \frac{F \cdot P}{2{,}000 \cdot \pi \cdot \eta}$$

Drive dimensioning

Basic principles

For drive dimensioning, the drive chain can be divided into the **mechanical system** and **drive system**.
The **mechanical system** includes the physical components – electromechanical cylinder EMC (including gear unit transmission element) – and the load to be carried.
The electric **drive** is a motor-controller combination with corresponding performance data.
The dimensioning of the electric drive is done taking the motor shaft as a reference point.
For drive dimensioning, limits must be taken into account as well as base values. The limits must not be exceeded in order to avoid damaging the mechanical components.



Technical data and formula symbols for the mechanical system

The relevant data for flange / coupling or belt side drive is already included in the specifications for the electromechanical cylinder EMC. In other words, the corresponding maximum permissible limits for drive torque and speed, as well as the underlying friction torque and mass moment of inertia with respect to the motor shaft are reduced, and can be taken directly from the tables (see "Drive data").
The following technical data with the associated symbols are used when considering the basic mechanical system requirements in the design calculations for drive dimensioning. The data listed in the table below can be found in chapter "Technical Data" or is determined using formulas based on the descriptions on the following pages.

		Mechanical system	
		Load	**EMC**
Weight moment	(Nm)	M_g [4]	–
Equivalent dynamic torque	(Nm)	M_m [1]	–
Friction torque	(Nm)	–	M_{Rs} [3]
Mass moment of inertia	(kgm^2)	J_t [1]	J_s [2]
Max. permissible travel speed	(m/s)	–	v_{max} [3]
Max. permissible rotary speed	(min^{-1})		n_P [3]
Max. permissible drive torque	(Nm)	–	M_p [3], M_{pl} [1]

[1] Determine the value using the appropriate formula
[2] Length-dependent value, determined using the appropriate formula
[3] Use the value from the table
[4] For vertical installation position: Determine the value using the appropriate formula

Drive dimensioning with motor shaft as reference point

When dimensioning the drive, all relevant design calculation values for the mechanical components in the drive chain have to be determined and be expressed/reduced to the motor shaft. In other words, for a combination of mechanical components within the drive chain, this will result in one value for each of the following:

- Friction torque M_R
- Mass moment of inertia J_{ex}
- Max. permissible speed v_{mech} (maximum permissible rotary speed n_{mech})
- Max. permissible drive torque M_{mech}

Determination of the values for each mechanical component in the drive chain based on the motor shaft as a reference point

Friction torque M_R

With the value for friction torque of the EMC, friction is already reduced to the motor shaft.

$$M_R = M_{Rs}$$

Mass moment of inertia J_{ex}

The constants $k_{J\,fix}$, $k_{J\,var}$ and $k_{J\,m}$ used in the formulas already contain the mass moment of inertia and gear ratios for any incorporated transmission elements, and can therefore be taken from the "Drive data" table.

$$J_{ex} = J_s + J_t$$

Determining the mass moment of inertia of the EMC component (including transmission elements, if used)

$$J_s = (k_{J\,fix} + k_{J\,var} \cdot s_{max}) \cdot 10^{-6}$$

Determination of the translative mass moment of inertia of the external load (reduced to motor shaft)

$$J_t = m_{ex} \cdot k_{J\,m} \cdot 10^{-6}$$

Maximum permissible speed and maximum permissible rotary speed

The value for the maximum permissible speed of the EMC already includes the permissible rotary speed for any incorporated transmission elements.

Maximum permissible speed v_{mech}

$$v_{mech} = v_{max}$$

Maximum permissible rotary speed n_{mech}

$$n_{mech} = n_p$$

When considering the complete drive chain (mechanical system + motor/controller) the rotary speed of the motor can lie below the maximum value for the mechanical system (M_{mech}) and thus limit the maximum permissible rotary speed of the overall drive chain.

Drive dimensioning

Maximum permissible drive torque M_p, M_{mech}

The lower value of the permissible drive torque of all mechanical components contained in the drive chain (M_p) and allowable axial load from the user-defined installation case determines the maximum permissible drive torque of the mechanical system which needs to be taken into account as a limitation in the drive dimensioning.

The smaller value from the drive data table or that calculated from the F_{max} value from the permissible axial load on the cylinder mechanism diagram is valid.

$$M_{pl} = \frac{F_{max} \cdot P}{2{,}000 \cdot \pi \cdot \eta}$$

$$M_{mech} = \text{Minimum } (M_{p;}\, M_{pl})$$

When considering the complete drive chain (mechanical system + motor/controller) the maximum torque of the motor can lie below the maximum value for the mechanical system (M_{mech}) and thus limit the maximum permissible drive torque of the overall drive chain.

If the maximum torque of the motor lies above the upper limit for the mechanical system (M_{mech}), the maximum motor torque must be limited to the permissible value for the mechanical system.

Pre-selecting the motor

The motor can be generally preselected using the following conditions.

Condition 1:

The rotary speed of the motor must be greater than or equal to the rotary speed required for the mechanical system (but not exceeding the maximum permissible limit value).

$$n_{max} \geq n_{mech}$$

Condition 2:

Consideration of the ratio of mass moments of inertia of the mechanical system and the motor. The ratio of the mass moments of inertia serves as an indicator for the control performance of a motor-controller combination.

The mass moment of inertia of the motor is directly related to the motor size.

Mass moment of inertia ratio

$$v = \frac{J_{ex}}{J_m + J_{br}}$$

For preselection, experience has shown that the following ratios will result in high control performance.

These are not rigid limits, but values exceeding them will require closer consideration of the specific application.

Application area	V
Handling	≤ 6.0
Machining	≤ 1.5

Condition 3:
Estimation of the ratio of the static load moment to the continuous torque of the motor. The torque ratio must be less than or equal to an empirical value of 0.6. This condition roughly factors in the missing dynamic characteristics of an exact motion profile with the required motor torques.

Torque ratio:

$$\frac{M_{stat}}{M_0} \leq 0.6$$

Static load moment:

$$M_{stat} = M_R + M_g + M_m$$

Weight moment:
For vertical installation position only!
For motor attachment via flange and coupling: i = 1

$$M_g = \frac{P \cdot (m_{ex} + m_{ca}) \cdot g}{2\,000 \cdot \pi \cdot i \cdot \eta}$$

Equivalent dynamic torque:

$$M_m = \frac{F_m \cdot P}{2\,000 \cdot \pi \cdot i \cdot \eta}$$

The equivalent dynamic torque can be calculated approximately via the average load F_m.
The appropriate mechanical efficiency must be used depending on the drive element BASA.

In chapter "Configuration and ordering", users can put together standard configurations including gear reducer and motor, for the various EMC sizes by selecting the appropriate options. By checking the three conditions stated above, it is possible to see whether a standard motor selected in a particular configuration will generally be of a suitable size for the specific application.

Precise drive dimensioning

Preselecting the motor according to this rough guide is no substitute for the required precise design calculations for the drive, taking all moments/torques and rotary speed levels into account. For precise calculation of the electric drive, including consideration of the specific motion profile, please refer to the performance data in the catalog "Rexroth drive technology". When dimensioning the drive, the maximum permissible values for speed, drive torque and acceleration must not be exceeded, in order to avoid damaging the mechanical system!

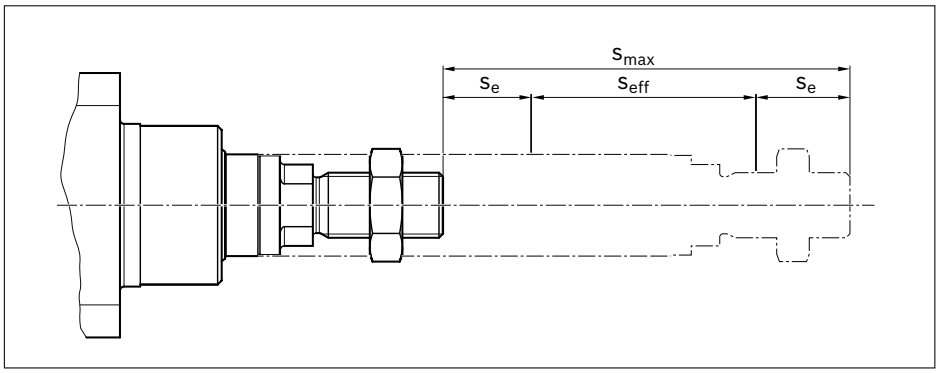
Effective stroke

Excess travel must be greater than braking distance. The acceleration travel can be taken as a guideline value for braking distance.



$$s_{eff} = s_{max} - 2 \cdot s_e$$

s_e	=	Excess travel	(mm)
s_{eff}	=	Effective stroke	(mm)
s_{max}	=	Maximum travel	(mm)

Length calculation:

Overall length of EMC for motor attachment with flange and coupling = $L_{zs} + s_{max} + L_{ad} + L_f + L_m$

Overall length of EMC for motor attachment with belt side drive = $L_{zs} + s_{max} + L_{ad} + G$

(for L_f, L_m and G, see following page)

L_{ad}	L_Z	$M_{M\ f8}$	R_T	B_G	R_L	SW	T_G	V_A ±0.1	V_D	V_{FB}	V_{FD}	V_G ±0.1	W_A

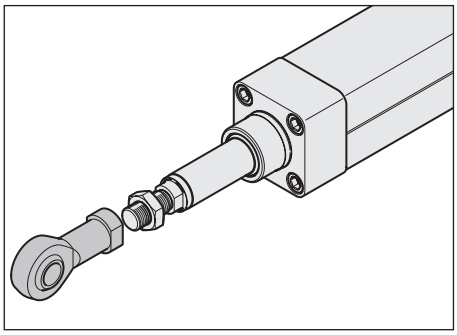
[1] Do not exceed max. permissible screw-in depth for "M" threads

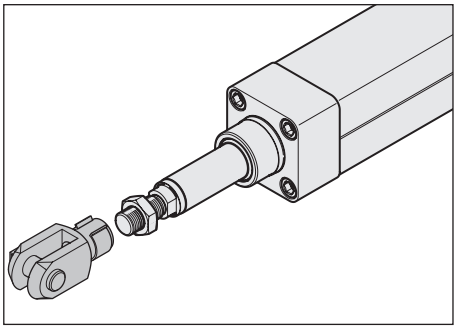
Fastener

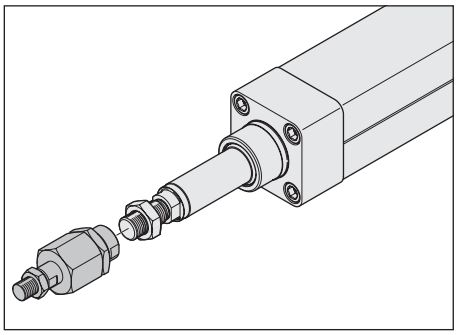
⚠ When you order an EMC with flange, motor and foot mounting or trunnion on the bottom, the unit is delivered fully assembled. When assembling these fastening elements retrospectively to the cylinder base, the flange first needs to be disassembled.
The "Instructions EMC", R320103102 that are part of the product must be observed.

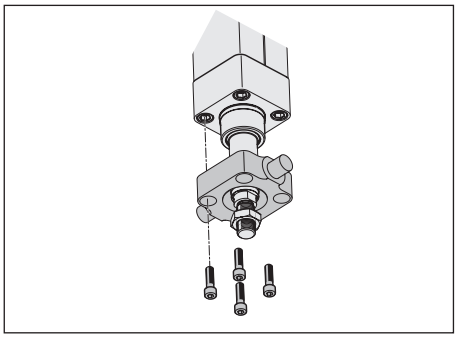
The fastening elements are mounted on the rear of the belt side drive. The screws are included with the fastening elements.
Before mounting the fastening elements, remove the set screws on the belt side drive.

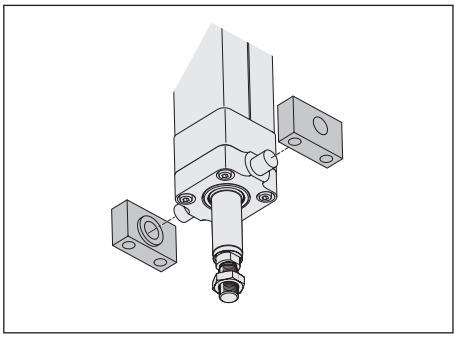
Examples

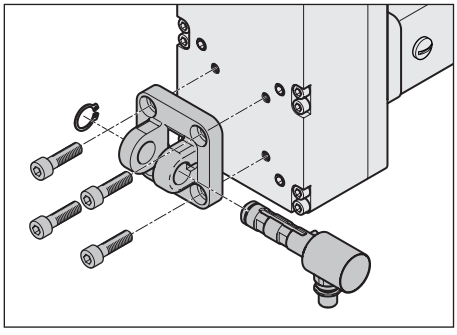


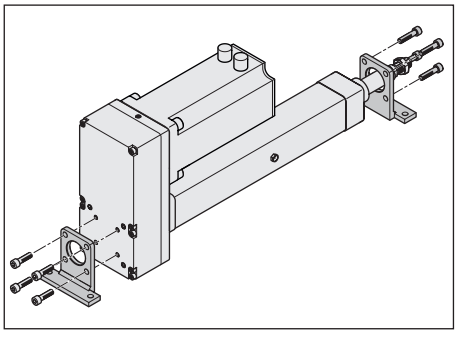


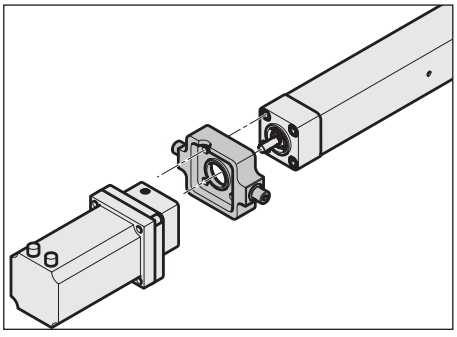


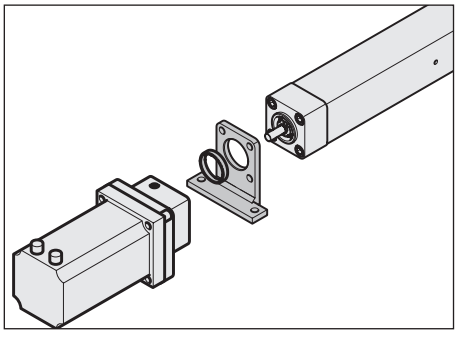


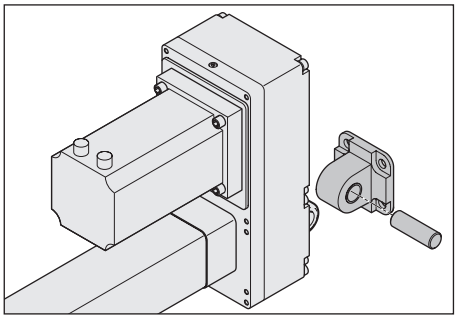


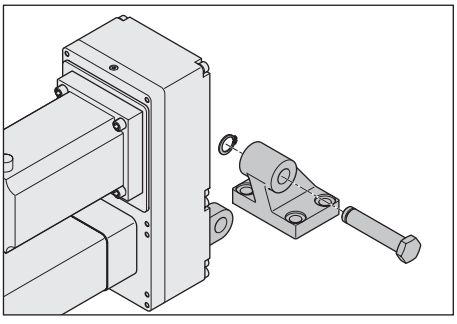












Fastening elements

Female spherical rod end bearing

Accessories

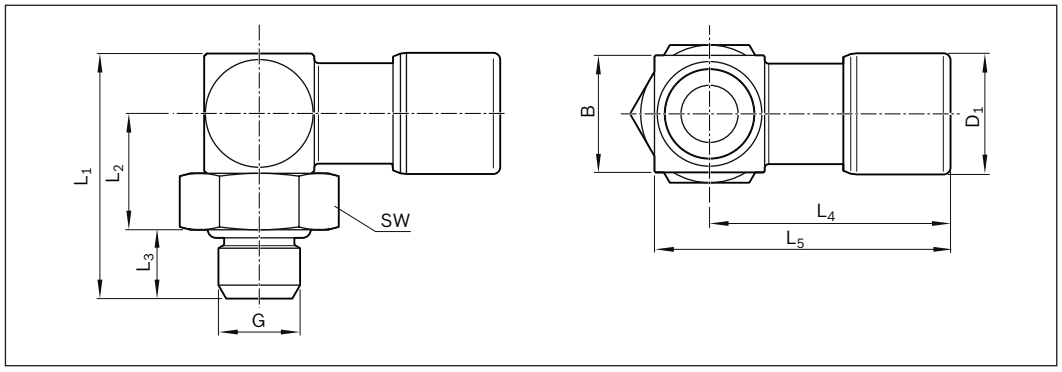
Connection for central lubrication system

Is supplied once as part of the delivery if the lubrication option LCF has been chosen (prepared for central lubrication system for liquid grease).



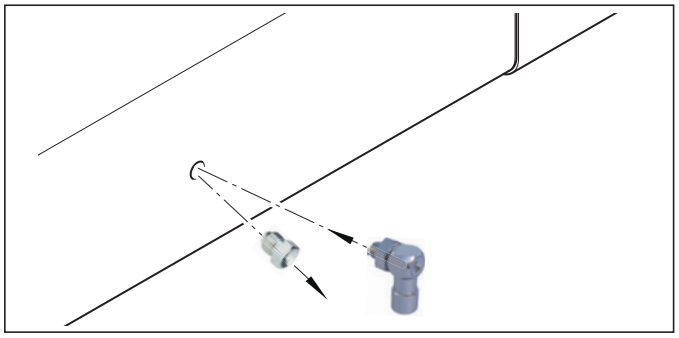
Material number	Material	G	for tubing	Dimensions (mm)								m
				SW	L_1	L_2	L_3	L_4	L_5	B	D_1	(g)
R913031697	Nickel-plated brass (for housing option (standard and IP65)	M6	AD4(4/2)	10	17.8	8.5	5	17.5	21.5	8.5	8.8	10
R913031717	Corrosion-resistant steel 1.430/1.4307 (for housing option IP65+R)											

Features

- Enclosed O-ring
- Seals FPM
- Temperature range –20 to +120 °C
- Operating pressure range –0.95 to 24 bar

Instruction for mounting

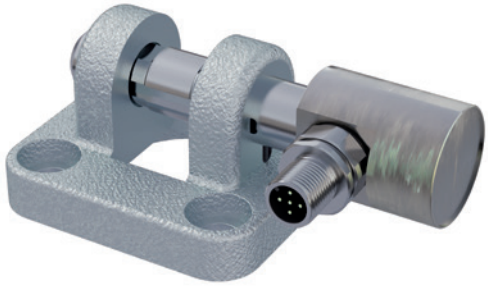
In order to connect the EMC to a central lubrication system, remove the standard lube nipple from the housing and replace it with the port for the central lubrication system.



Force sensor

Force measuring bolt

Clevis mount with force measuring bolt



If your application requires precise load sensing, there is a clevis bearing block version with force measuring bolt available for this purpose. This option can be selected both at the piston rod end connected to the spherical rod end bearing, and at the belt side drive.
Thanks to the thin-film technology used, the load cells are very robust and stable over the long term. The load cells are compliant with the EN 61326 standard for electromagnetic compatibility (EMC) and are designed to sense both tensile and compressive forces.

Note
The use of a hammer or press to fit the bolt is not permissible. It may only be inserted by hand.
The bolt is not suitable to handle torques. It is secured axially and against rotation, like the standard bolt, on one side of the clevis mount using the included retaining ring and clamping pin.
For force control at the controller level, a control component with an analog input is required.

Output signal 4 - 20 mA, reduced measurement range and test certificate on request.

Technical data, force measuring bolts

Metrological specifications

Material	Stainless steel
Enclosure protection class	IP65
Hardness (load range)	38 HRC
Mechanical system	
Operating load	150% of MB
Breaking load	300% of MB
Accuracy	
Non-linearity	±0.5% of MB
Repeatability	±0.25% of MB
Hysteresis	±0.2% of MB
Temperature drift at zero point	±0.05% of MB/K.
Temperature drift over measurement range	±0.05% of MB/K.
Compensated temperature	+10 ... +40 °C
Operating temperature	–20 ... +60 °C

Electrical specifications

Output signal	0kN	0±0.03 V
Output signal	MB	–10 ... 10 V ±0.2 V
Power supply voltage		24 V ±2 V
Tare (zero setting function)		7.2 ... 24 V
Current consumption		25 mA (24 V)
Bandwidth		2.5 ±0.2 KHz
Connection		Plug M12x1

Technical data, connection cable

Length	5 m
Rated voltage	250 V
Rated current	4 A
Plug outlet	angled
Connection type 1	Female connector, M12, 4-pin
Connection type 2	Flying leads
Type of cable	PUR black, shielded
Suitable for drag chains	yes
Cable cross-section	4x0.34 mm²
Cable diameter D	5.9 ±0.2 mm
Static bending radius	>10xD
Dynamic bending radius	>5xD
Bending cycles	> 2 Mio
Ambient temperature, stationary	–25 ... +80 °C
Ambient temperature, in motion	–40 ... +80 °C
Enclosure protection class	IP65

Connection cable in the scope of delivery

MB = Measurement range
MB/K. = Measurement range per Kelvin

Features

- For tensile and compressive forces
- Corrosion-resistant Stainless steel version
- Integrated amplifier
- Low temperature coefficient
- High long term stability
- High shock and vibration resistance
- For dynamic or static measurements
- Good reproducibility
- Easy mounting

Version:

- Plain shaft without shaft seal
- M5 multi-turn absolute encoder (20-bit, absolute encoder function only available with backup battery)
- Cooling system: natural convection
- IP54 enclosure protection class (shaft: IP40)
- With and without brake
- M17 metal round connector

Note

Motors are available with control units and controllers. You can find more information on motors and controllers in the Rexroth catalogs on drive technology at

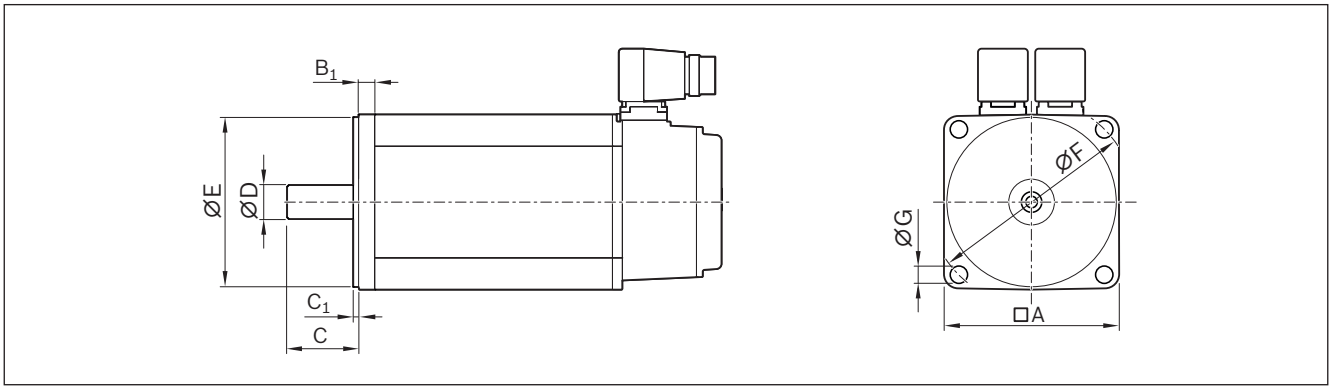
Motor attachment kits according to customer specification

The motor attachment for linear motion systems with Rexroth ball screw assembly consists of either an attachment kit with flange and coupling (MF) or a belt side drive (SD).
The available combinations are shown in the "Configuration and ordering" selection tables for each size. In addition to attachment kits for Rexroth motors, attachment kits for motors according to customer specification are also available. In order to determine the appropriate attachment kit, the connection geometry of the motor is crucial. Characteristics required to clearly determine motor geometry are shown below.

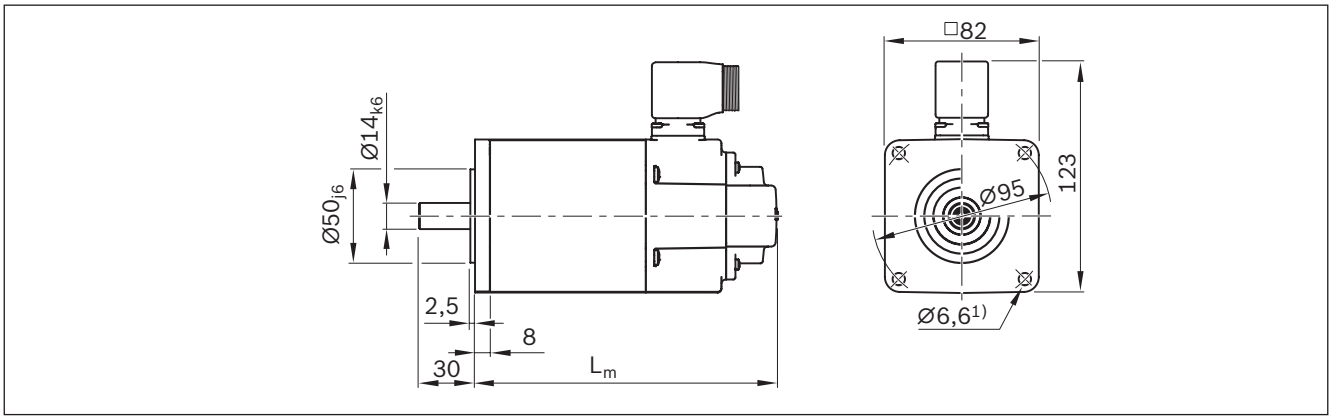


The dimensions queried result in a unique "motor geometry code":

□□ – □□ – □□□ – □□□ – □□□ – M□□ – □□□ – □□□

ØD	=	Shaft diameter
C	=	Shaft length
ØE	=	Centering diameter
C_1	=	Centering depth
ØF	=	Pitch diameter
ØG	=	Drill hole for mounting screw (specify thread diameter)
B_1	=	Flange thickness
A	=	Flange edge dimension

Example illustration of servo motor IndraDyn S type MS2N04



1 4 – 3 0 – 0 5 0 – 2 . 5 – 0 9 5 – M 0 6 – 0 0 8 – 0 8 2

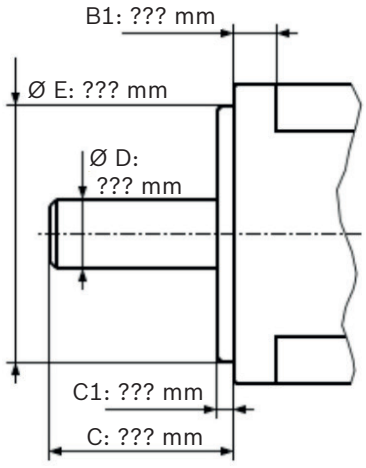
[1)] The drill hole Ø 6.6 mm results in the type designation M06 for the geometry motor code (nominal thread diameter mounting screw M6).

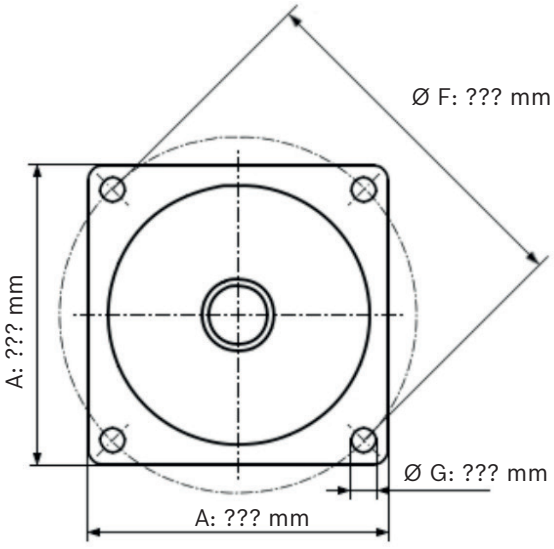
Motor attachment kits for motors according to customer specification can be selected using the online configurator in the eShop. To do this, select the "mechanical interface" and "motor according to customer specification" option.

Size customer motor

Motor manufacturer

Motor type



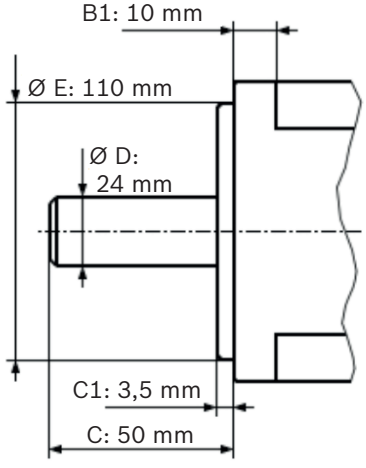


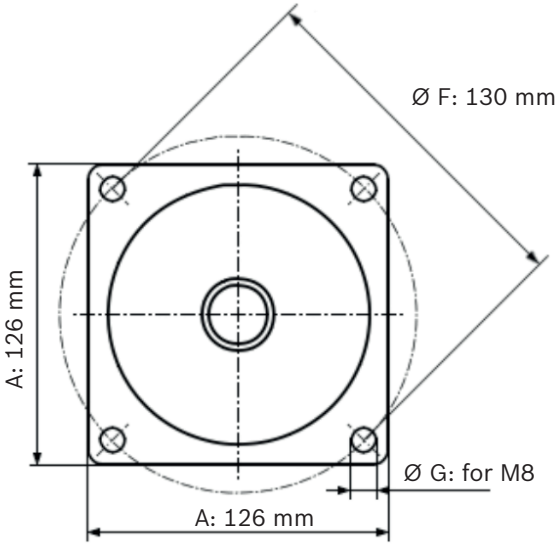
Example

Size customer motor

Motor manufacturer: Siemens

Motor type: 1FK706



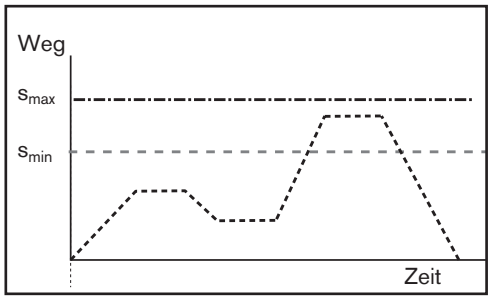


Operating conditions and usage

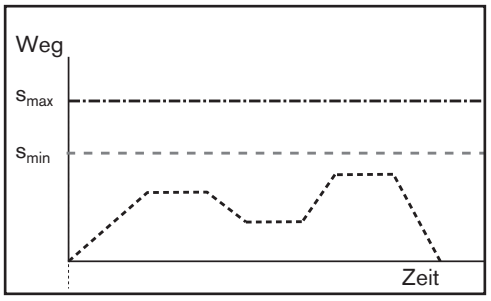
Normal operating conditions

Ambient temperature with Bosch Rexroth servo motor	0 °C ... 40 °C, above 40 °C loss of performance
Ambient temperature Mechanical system (no dropping below dew point)	–10 °C ... 50 °C
Enclosure protection class	IP54, IP65 as an option
Duty cycle	100%
Normal stroke	The distance traveled per cycle is ≥ s_{min} (see diagram)

Stroke definition



Normal stroke



Short stroke

Short stroke: The distance traveled per cycle is **<** s_{min} (see diagram).

Short stroke case 1:
Distance traveled in the cycle < s_{min} and > 2 x screw lead:
- Perform the service life calculation with 69% of the dynamic load rating
- Halve the maintenance interval (see "Instructions EMC R320103102")

Short stroke case 2:
Distance traveled in the cycle < s_{min} and ≤ 2 x screw lead:
- Only permissible with regular lubricating strokes
- Perform the service life calculation with reduction to the dynamic load capacity
- Adapt maintenance interval

Contact Bosch Rexroth for further details.

Notes

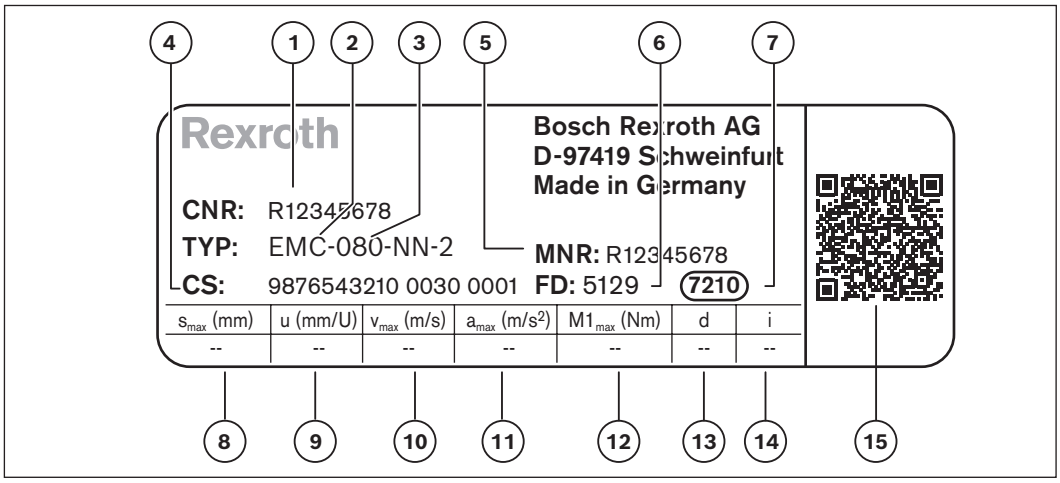
For more information about intended use and safety, see "Safety instructions for linear motion systems R320103152".

For more information on assembly/start-up see "Instructions EMC R320103102".

PDF files of these documents can be found on the Internet at:
www.boschrexroth.com/mediadirectory

Parameterization (start-up)

The nameplate contains reference information on the production of the linear motion system as well as technical start-up parameters.



1	CNR	Customer's material number
2	TYP	Short product name
3	080	Size
4	CS	Customer information
5	MNR	Material number
6	FD	Date of manufacture
7	7210	Manufacturing location
8	s_{max}	Maximum travel range
9	u	Feed constant without motor attachment
10	v_{max}	Maximum travel speed
11	a_{max}	Maximum acceleration rate
12	$M1_{max}$	Maximum drive torque at motor journal
13	d	Direction of motor rotation to travel in positive (+) direction CW = clockwise CCW = counterclockwise
14	i	Gear ratio
15		QR-Code

Note

The values given describe the mechanical limit values of the axle.
Limit values for the included fastening elements and application-related installation cases are not taken into account here.

Lubrication and maintenance

Grease lubrication

The advantage of grease lubrication is that Rexroth ball screw assemblies can run for prolonged periods without needing relubrication.

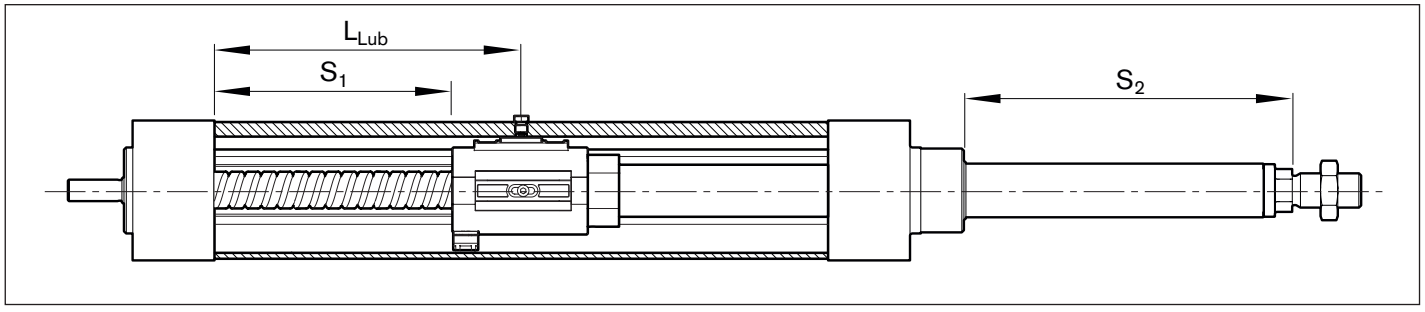
All high-quality ball bearing lubricating greases can be used. Follow the lubricant manufacturer's instructions!

Greases in accordance with DIN 51825-K2K and, for higher loads, KP2K of grade NLGI 2 in accordance with DIN 51818 are recommended for the longest possible lubrication intervals. Tests have shown that grade NLGI 00 greases achieve only about 75% of the travel life of grade 2 at higher loads.

Lubrication position and notes on lubrication

Basic lubrication is applied in-factory before shipment. When selecting the LPG option (preserved version), initial lubrication by the customer is necessary prior to start-up.

The electromechanical cylinders are designed for grease lubrication using a manual grease gun with a lubricating pin, or for connecting to a central lubrication system (with liquid grease). Maintenance is limited to relubrication of the Rexroth ball screw assembly. In order to reach lubrication position L_{Lub}, move the piston rod to stroke position S_2. For this purpose, move S_1 from the rear end position according to the table. For more information, see "Instructions EMC, R320103102".



EMC	P[1] (mm)	L_{Lub} (mm)	S_1 (mm)	S_2 (mm)

[1] BASA lead

[2] s_{max}: maximum travel range of the EMC (see name plate)

Recommended lubricants

Note

Do not use lubricants with solid particles (e.g. graphite or MoS_2 additives).
For central lubrication systems we recommend using Dynalub 520.

Elkalub GLS 135 / N2 (Chemie-Technik) Tribol GR 100-2 PD (Castrol)	Elkalub GLS 135 / N00 (Chemie-Technik) Tribol GR 100-00 PD (Castrol)

Initial lubrication with NSF-H1 lubricant:

Ball screw assembly and other components are pre-lubricated with NSF-H1 lubricant.

Even when using an H1 lubricant, the EMC is only conditionally suitable for use in the foodstuff industry.

H1 lubricants or separating agents (anti-corrosion agents) only have H1 approval if they are available with grade purity in an unmixed state. A blend of two H1 approval lubricants or separating agents does not have H1 approval. Owing to the preservation used for the ball screw assembly, the H1 lubricant in the EMC does not have grade purity.

Information on the materials used is available upon request.
In case of any doubt, please consult Bosch Rexroth.

Connection for central lubrication system

For additional information, please refer to chapter "Attachments and accessories".

Documentation

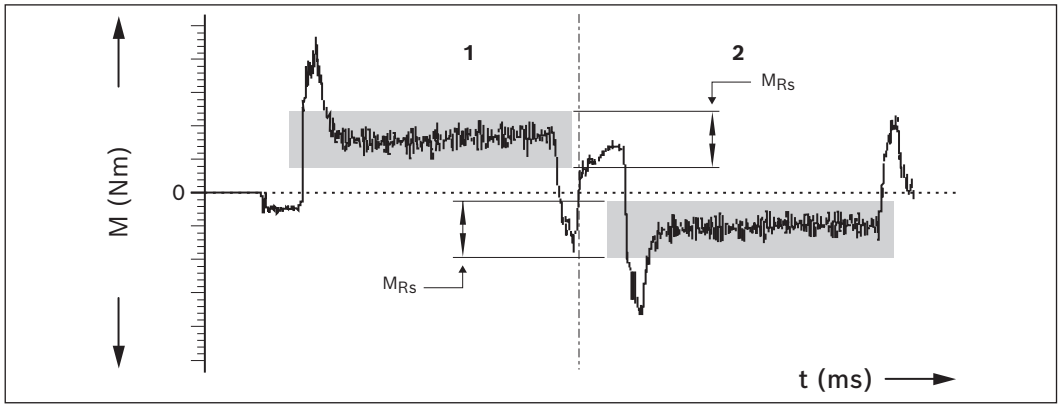
Standard report
Option 01

The standard report serves to confirm that the checks listed in the report have been carried out and that the measured values lie within the permissible tolerances.
Checks listed in the standard report:

- Functional checks of mechanical components
- Functional checks of electrical components
- Design as per order confirmation

Measurement of frictional torque of complete system
Option 02
All items as per the standard report.
The friction torque M is measured over the entire travel range.

Example diagram

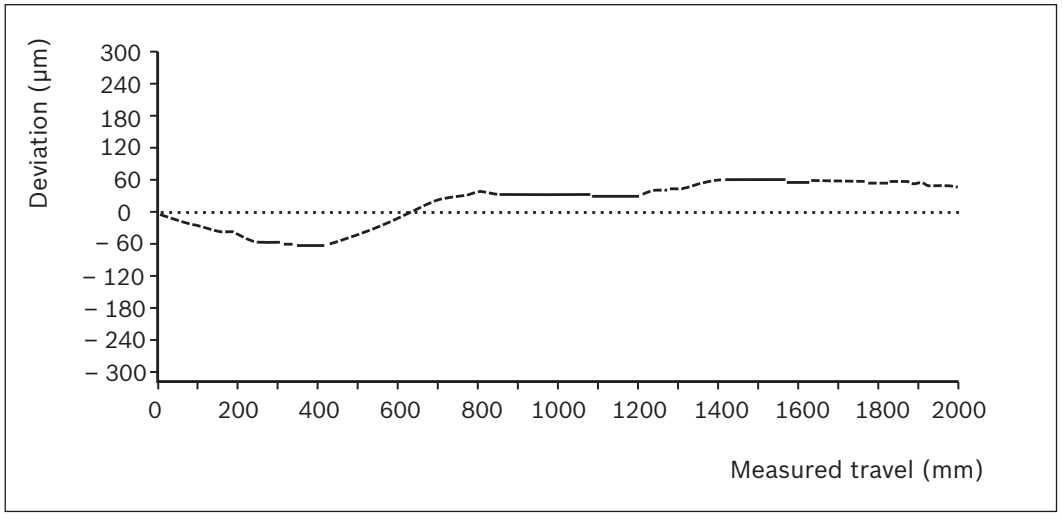


1 Advance
2 Return

M_{Rs} = Friction torque (N)
t = Travel time (ms)

Lead deviation of screw drive
Option 03
All items as per the standard report.
In addition to the graphical illustration (see figure), a measurement report is included in tabular form.

Example diagram



Abbreviations

Abbreviation/ index	Name	Unit
a	Acceleration	(m/s^2)
a_{max}	Maximum acceleration rate	(m/s^2)
BASA	Ball screw assembly	(–)
C	Dynamic load capacity, guideway	(N)
d_0	Nominal diameter of ball screw assembly	(mm)
F_1, F_2, ... F_n	Axial load during phases 1 ... n	(N)
F_m	Equivalent dynamic axial load	(N)
i	Gear ratio	(–)
J_{br}	Mass moment of inertia of the motor brake	(kgm^2)
J_{ex}	Mass moment of inertia of the mechanical system	(kgm^2)
J_{ge}	Mass moment of inertia of the gear at motor journal	(kgm^2)
J_m	Mass moment of inertia of motor	(kgm^2)
J_s	Mass moment of inertia	(kgm^2)
J_t	Translative mass moment of inertia of external load based on the linear motion system screw journal	(kgm^2)
$k_{g\ fix}$	Constant for fixed portion of mass	(kg)
$k_{g\ var}$	Constant for variable-length portion of mass	(kg/mm)
$k_{J\ fix}$	Constant for fixed portion of mass moment of inertia	($kgmm^2$)
$k_{J\ m}$	Constant for mass-specific portion of mass moment of inertia	(mm^2)
$k_{J\ var}$	Constant for variable-length portion of mass moment of inertia	(kgmm)
L	Nominal service life – in revolutions – in meters	 (min^{-1}) (m)
L_{ad}	Additional length	(mm)
L_h	Nominal service life	(h)
L_m	Length of the motor	(mm)
m_{br}	Mass of the brake	(kg)
m_{ex}	Moved external load	(kg)
m_{fc}	Mass of flange and coupling	(kg)
m_m	Mass of the motor	(kg)
m_s	Mass of the linear system (without attachments)	(kg)
m_{sd}	Mass of the timing belt side drive	(kg)
M_0	Continuous motor torque	(Nm)
M_m	Equivalent dynamic torque	(Nm)
M_{max}	Max. possible motor torque	(Nm)
M_{mech}	Maximum permissible drive torque for mechanical system	(Nm)
M_p	Maximum permissible drive torque (at drive journal)	(Nm)
M_R	Frictional torque at motor journal	(Nm)
M_{Rs}	Friction torque of system	(Nm)

Abbreviation/ index	Name	Unit
M_{stat}	Static load moment	(Nm)
n_1, n_2, ... n_n	Rotary speed in acceleration and braking phases	(min^{-1})
n_{mech}	Maximum permissible rotary speed for mechanical system	(min^{-1})
n_{max}	Max. motor speed	(min^{-1})
n_p	Maximum permissible rotary speed	(min^{-1})
P	Screw lead	(mm)
s_e	Excess travel (excess travel s_e should be greater than braking distance. The acceleration travel can be used as a guideline value for braking distance.)	(mm)
s_{eff}	Effective stroke	(mm)
s_{min}	Min. travel range	(mm)
s_{max}	Maximum travel	(mm)
t_1, t_2, ... t_n	Time for phase 1 ... n	(s)
u	Feed constant	(mm/U)
v_1, v_2, ... v_n	Speed in phase 1 ... n	(m/s)
v_{max}	Maximum permissible speed	(m/s)
v_{mech}	Maximum permissible speed of mechanical system	(m/s)
v_m	Average linear speed	(m/s)
V	Ratio of mass moments of inertia of drive chain and motor	(–)
π	Pi	(–)

Electromechanical cylinder EMC-040-NN-2

Ordering data		Option	Explanation
Short product name		EMC-040-NN-2	
Max. travel range		580	580 mm
Housing		01	Standard
Drive		02	Rexroth ball screw assembly 16 x 10
Lubrication		02	LCF
Sensor profile		80	With sensor profile
Switch 1		122	PNP NO contact
Version		MF01	With flange
Motor attachment		06	Attachment kit (flange and coupling) for MS2N03
Motor		203	MS2N03, without brake, 1 cable
Documentation		01	Standard
Fastening elements	**Group 1**	00	None
	Group 2	01	Female spherical rod end bearing
	Group 3	06	Foot mounting
	Group 4	00	None
	Group 5	05	Foot mounting
	Group 6	00	None
